

# Proceedings of the NGV Global Technical Forum

Held in Conjunction with NGV Global 2014 Conference and Exhibition

Long Beach, California, May 5<sup>th</sup> 2014

Session 2 of 2

## OBJECTIVE

The Technical Forum is open to all NGV Global members. The objective is to explore technical issues in a more detailed and informal forum than normal conference sessions allow. The focus is on critical issues requiring resolution which will help to define technical objectives and priorities for NGV Global to pursue.

## ATTENDANCE

Approximately 60 people participated in the Technical Forum 2014. A partial list of Attendees was captured and is appended to these proceedings.

## AGENDA

| Item                                  | Description  |
|---------------------------------------|--|
| <b>1. Gas Composition and Quality</b> | <ul style="list-style-type: none"><li>The discussion will identify the separate issues associated with the composition of CNG, and biogas/biomethane, allowing the Technology Forum to consider what actions by NGV Global might be appropriate to add to the debate. (Dr Jeffrey Seisler)</li></ul> |

# GAS COMPOSITION AND QUALITY

## NGV Global Technical Forum

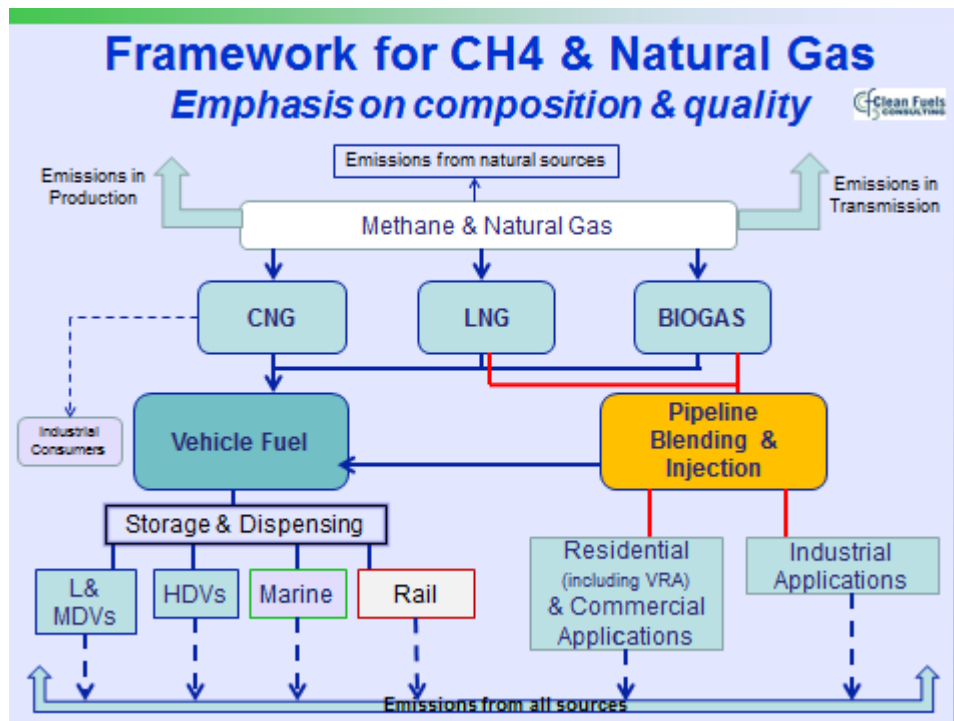

5 May 2014

Long Beach, California

Issues associated with gas composition and quality

Dr. Jeffrey Seisler, CEO

## General issues for natural gas composition & quality

- Methane content (level & methodology)
- Wobbe index: in broad terms, heating value at the 'burner tip'<sup>\*</sup>
- Methane number: anti-knock value, i.e. octane (propensity not to self ignite) (*vehicle industry vs gas industry*):
  - *The 'number' (lowest level)*
  - *The methodology to determine MN*
- Water content
- Contaminants (H<sub>2</sub>S, sulphur [incl.odorant])
  - *Sulphur: foreseeable issue for gas industry*
- Other stuff: propane, H<sub>2</sub>, oil, dust,

<sup>\*</sup>MJ/per M<sup>3</sup> (Btu/Scf) divided by the square root of the specific gravity

## Other fuel composition issues

- **Biogas** (raw product before upgraded to biomethane)
  - Upgrading to '*pipeline quality*' biomethane
  - Bacteria (?) ('proven' not an issue)
  - Siloxanes, especially from landfill gas (detecting, measuring, and extricating)
- **LNG**
  - Ethane, especially over time in storage facilities (*weathering*)
  - Lack of odorant
  - Temperature/pressure (throughout vertically integrated transport-storage-end use)

## Requirements (and potential) for gas composition is very different for different stakeholders

- Energy distribution companies
  - *'pipeline quality'*
- Retailers of automotive methane fuels
  - *No water or oil pass-through (or 'other stuff')*
- Needs of the vehicle manufacturers
  - *Consistency, clean & 'high quality'*
- Driving customers
  - *Hgas/Lgas = range concerns*

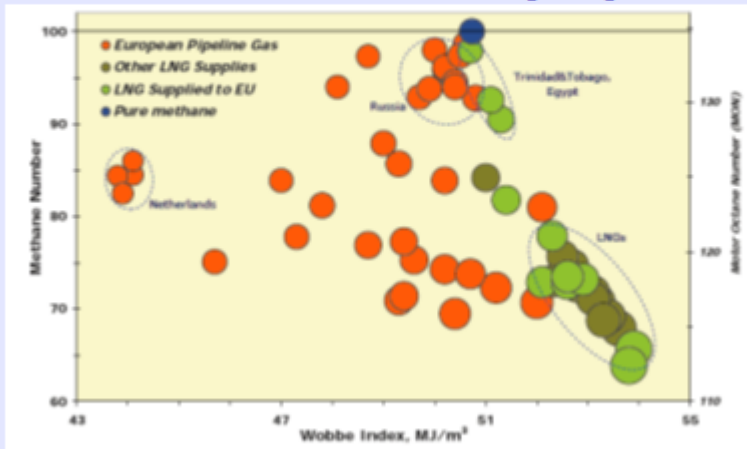

## Components in natural gas can have a variety of effects on engines & compressors

|                                      |   |
|--------------------------------------|---|
| Gross WI (MJ/m <sup>3</sup> )        | Power, fuel injection duration, OBD   |
| Sulfur                               | Deterioration of exhaust emission treatment device, deposit.<br>Use of odorants have been taken into account. |
| HC                                   | Liquefaction  |
| Methane Number                       | Anti-knock property   |
| Water (dew point)                    | Water condensation under certain conditions of usage.   |
| Lubricant contamination              | Function deterioration caused by compressor oil   |
| O <sub>2</sub> , H <sub>2</sub> , CO | Flammability, hydrogen embrittlement, attack on plastic and rubber, health effect                             |
| CO <sub>2</sub>                      | Liquefaction, attack on plastic and rubber, lowered WI  |
| Metal, Particulate Contaminants      | Malfunction caused by metallic and particulate contaminant  |

## Engines using LNG sourced gas can rely on higher Wobbe # than from pipelines

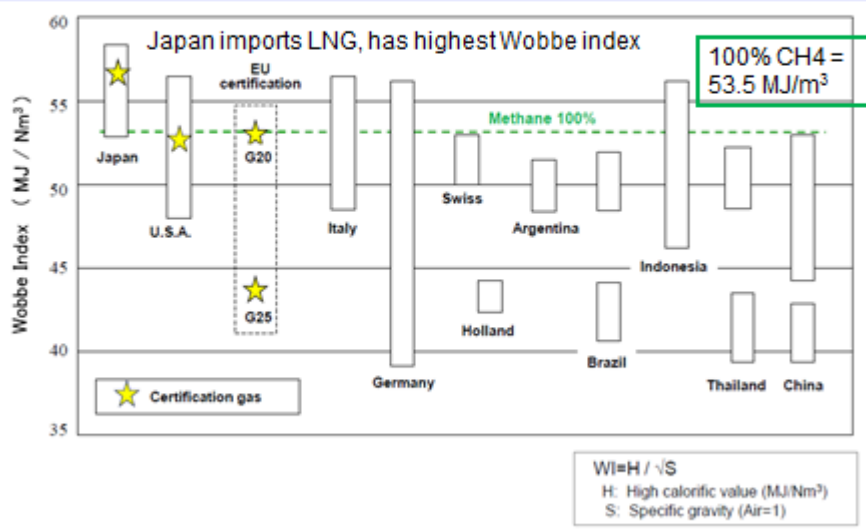

Size of the bubbles expresses the variations in Gross Calorific Value [GCV]

Source: LNG for Europe: Some important considerations, Joint Research Center, European Commission, 2009.

## Wobbe index (i.e. energy value) will affect combustion & engine power.

Source: Masato Matsuki (Honda R&D Co.), 'Study on Required CNG Qualities as an Automotive Fuel, as presented at ANGVA Conference, 28 November 2013

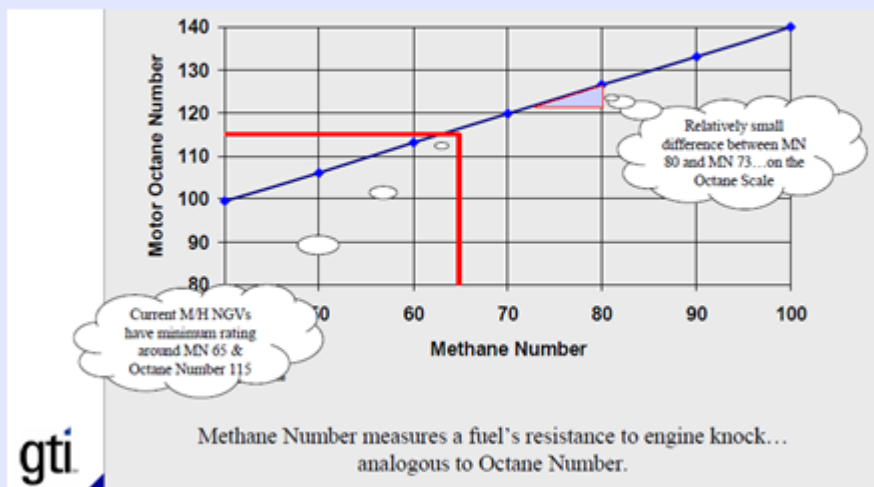

## Methane Number of gas worldwide should be sufficient to meet the demands of regional NGVs: Americas are high

Source: *Gas Quality: Leadership as a Driver for LNG in Transport Markets*, Stuart McDonald, Shell International, as presented at Clean Fuels Consulting Poli-techs workshop, 27 March 2013, Brussels.

## Natural gas has excellent knock resistance

Methane Number measures a fuel's resistance to engine knock... analogous to Octane Number.

Source: Bill Liss, *Natural Gas Composition for NGVs*, Gas Technology Institute.

## Samples of natural gas specifications show different requirements and realities in different world regions

### ① USA EPA(Federal)

| Item  |                | ASTM test method No. | Value |
|---|----------------|----------------------|-------|
| Methane   | min. mole pct. | D1945                | 89.0  |
| Ethane  | max. mole pct. | D1945                | 4.5   |
| C <sub>3</sub> and higher                                 | max. mole pct. | D1945                | 2.3   |
| C <sub>4</sub> and higher                                 | max. mole pct. | D1945                | 0.2   |
| Oxygen  | max. mole pct. | D1945                | 0.6   |
| Inert gases:<br>Sum of CO <sub>2</sub> and N <sub>2</sub> | max. mole pct. | D1945                | 4.0   |
| Odorant <sup>1</sup>                                      |                |                      |       |

### ② USA CARB

| Specification   | Limit                    |
|---|--------------------------|
| <b>Compressed Natural Gas Certification Test Fuel</b> |                          |
| Methane   | 90.0 ± 1.0 mole percent  |
| Ethane  | 4.0 ± 0.5 mole percent   |
| C <sub>3</sub> and higher hydrocarbon content         | 2.0 ± 0.3 mole percent   |
| Oxygen  | 0.5 mole percent maximum |
| Inert gases (CO <sub>2</sub> + N <sub>2</sub> )       | 3.5 ± 0.5 vol. percent   |

### ③ Japan

|                                 |                         |             |
|---------------------------------|-------------------------|-------------|
| Methane                         | (% mole)                | 85.0 over   |
| Ethane                          | (% mole)                | 10.0 under  |
| Propane                         | (% mole)                | 6.0 under   |
| Butane                          | (% mole)                | 4.0 under   |
| C <sub>3</sub> + C <sub>4</sub> | (% mole)                | 8.0 under   |
| C <sub>5</sub> upper            | (% mole)                | 0.1 under   |
| Others                          | (% mole)                | 1.0 under   |
| High heating value              | (Kcal/Nm <sup>3</sup> ) | 10410~11050 |
| Wobbe Index                     | (Kcal/Nm <sup>3</sup> ) | 13260~13730 |
| Sulfur                          | (mg/m <sup>3</sup> )    | 10.0 under  |

### ④ Europe <sup>※1</sup> CH<sub>4</sub> cert fuel = 86-100%

| Characteristics                 | Units                 | Range | Limits  |         |
|---------------------------------|-----------------------|-------|---------|---------|
|                                 |                       |       | minimum | maximum |
| <b>Reference fuel G20</b>       |                       |       |         |         |
| Composition:                    |                       |       |         |         |
| Methane                         | % mole                | 100   | 99      | 100     |

## Natural Gas Composition LNG main components

| Component | Formula                         | MW (kg/kmol) | NBP (°C) | NFP (°C) |
|-----------|---------------------------------|--------------|----------|----------|
| Nitrogen  | N <sub>2</sub>                  | 28.013       | - 195.5  | - 209.9  |
| Methane   | CH <sub>4</sub>                 | 16.043       | - 161.6  | -182.5   |
| Ethane    | C <sub>2</sub> H <sub>6</sub>   | 30.07        | -88.6    | -183.3   |
| Propane   | C <sub>3</sub> H <sub>8</sub>   | 44.097       | -42.0    | -187.7   |
| nButane   | nC <sub>4</sub> H <sub>10</sub> | 58.124       | -0.5     | -138.4   |
| iButane   | iC <sub>4</sub> H <sub>10</sub> | 58.124       | -11.8    | -159.6   |
| nPentane  | C <sub>5</sub> H <sub>12</sub>  | 72.151       | 36.06    | -129.8   |

One mol is defined as 6.022·10<sup>23</sup> atoms/molecules of a substance

The volume of one mol is 23.644 liters at standard conditions (15°C, 1 atm.)

MW=Molecular weight  
NBP=Normal Boiling Point  
NFP= Normal Freezing Point

# LNG compositions vary depending on its source

| Properties at bubblepoint at normal pressure  |                          | LNG Example 1 | LNG Example 2 | LNG Example 3 |
|---|--------------------------|---------------|---------------|---------------|
| <b>Molar content (%)</b>  |                          |               |               |               |
| N <sub>2</sub>  | Nitrogen                 | 0,5           | 1,79          | 0,36          |

## Fuel Composition 'Decisions' from CEN TC 408\* (Bio-&NG Composition)

- **Methane Number:** discussed 80 for non-grid (i.e. vehicles); (65 for gas into the grid– TC 234)
- **Wobbe Index:** Proposed range from Volvo is 47.2 – 50.3 MJ/Nm<sup>3</sup>. Issue under discussion.
- **Sulphur limits:** Proposed limit in order to assure proper operation of NGVs should be 10 mg/Nm<sup>3</sup> due to poisoning effect on the after-treatment equipment. (Values being discussed within CEN/TC 234 WG 11 for non-odorised and odorised gas).
- **H<sub>2</sub>S + COS** (carbonyl sulfide): proposed limit for is 5 mg/Nm<sup>3</sup>

## Fuel Composition 'Decisions' from CEN TC 408\* (Bio-&NG Composition)

- **Siloxanes:** CEN TC/408 discussing various preliminary limits:
  - $<0,1 \text{ mg/Nm}^3$  (also  $0,06 \text{ mgSi/kg}$ ) *for the vehicle fuel application*
  - $2 \text{ mgSi/m}^3$ ; *for pipeline injection*
- **Other contaminants:** filter out the rest of the 'nasties' (1 micron filter for dust; coalescing filters in fuel stream, etc.)

\*CEN TC 408 communication: Expert Group discussion, 2013,

## Fuel Composition Lessons *being* learned (The jury is still out)

- Gas composition should be identified: all applications
- Natural gas fuel composition *standards* must allow for *natural* and regional variations while achieving levels of energy content and combustion characteristics to satisfy the needs of regional gas consuming technologies.
- Regulations on sulfur could cause a re-think of gas odorization (big change for a small market)
- LNG standard challenging: *pipeline quality* needed
- Biomethane (upgraded from biogas) = *pipeline quality*, with potential for high methane content
- Compressor stations (public/private/VRAs) should have gas dryers on inlet side & filters (oil/dirt/metallics) on outlet side

## **Which is best?**

**Reduce fuel variation to enable optimized engines?**

**or....**

**Adapt engines to fuel variation?**

The answer is: Yes!

- In areas where fuel composition is widely varied, adaptive engine technology would be useful.
- In areas with a relatively stable and high quality gas, engines can be optimized for local conditions (and so long as they are not driving into areas with lower quality gas).
